InelNet

- **manufacturer: Inel**
- automating everyday tasks
- manual system control option
- local or internet control
- one-way communication 433.92 MHz

The InelNet internet control panel is a gateway to the world of smart homes and remote control of window covers, garage and entrance gates, lighting, and even electrical sockets. It is based on one-way communication, which means that it sends commands to paired devices. Control can be manual or via created scenarios.

Why it is worth recommending the InelNet control panel:

- **it can work with a very wide range of devices**, including awnings, rolling grilles and light points, making it well-suited for commercial properties
- **it can be operated from a dedicated application or a regular web browser**, thus providing easier system access to more people
- **it allows grouping devices** so that a single command or scheduled task is performed by two or more devices

Choose the InelNet control panel if your customers:

- **are looking for a way to integrate compatible window covers and gates into a unified smart home system**, especially roller shutters with R, PR and LER series drives
- **need a cost-effective smart home control system** that will work with a convenient phone app or from a regular browser
- **expect a simple mechanism for automating typical tasks** that can be performed manually, locally or over the Internet if needed
