- Hollow blades NE103/NE104
- Blade rotation range 0° to 110°
- Lateral water drainage into the closed chamber of the supporting column
- Powder coating in RAL colors (Qualicoat)

The pergola is a modern alternative to all kinds of awnings and garden umbrellas. It perfectly complements any garden and terrace. Pergolas create a comfortable relaxation space that can be additionally secured with the aluminum sliding system Slide Glass and side screens that guarantee wind protection.

The louvered roof, or bioclimatic pergola, is built from at least four (two in the wall-mounted variant) supporting columns and a roof made of rotating louvers. Their positioning allows you to control the amount of sun exposure and can also protect against rain. This is done via a switch on the pergola column or remotely.

The functionality of pergolas is extended by the accessories available for them. These can include weather stations that automatically respond to environmental conditions, LED lighting, and heat radiators. The installation is highly aesthetic thanks to the concealed mounting elements of the supports.
