SWISSPACER Air

- **Frames for glass panes that will be subjected to large differences in atmospheric pressure, e.g. as a result of air transport or installations in the mountains.**

The SWISSPACER AIR component allow for pressure equalization in the insulating glass chambers, which is necessary during transport, during which there is a significant difference in height or when installing windows at a high height relative to the production site.

The change in the volume of gases filling the inter-pane chambers in the glazing packages, occurring as a result of changes in atmospheric pressure and temperature, may lead to deformation or even cracking of the panes. The SWISSPACER AIR component equalizes the pressure, which is necessary when transporting windows by helicopters or cable cars, and even when using vehicles to places where there are large differences in height.
