ENTRA

ALUMINIUM WINDOWS NEW GENERATION

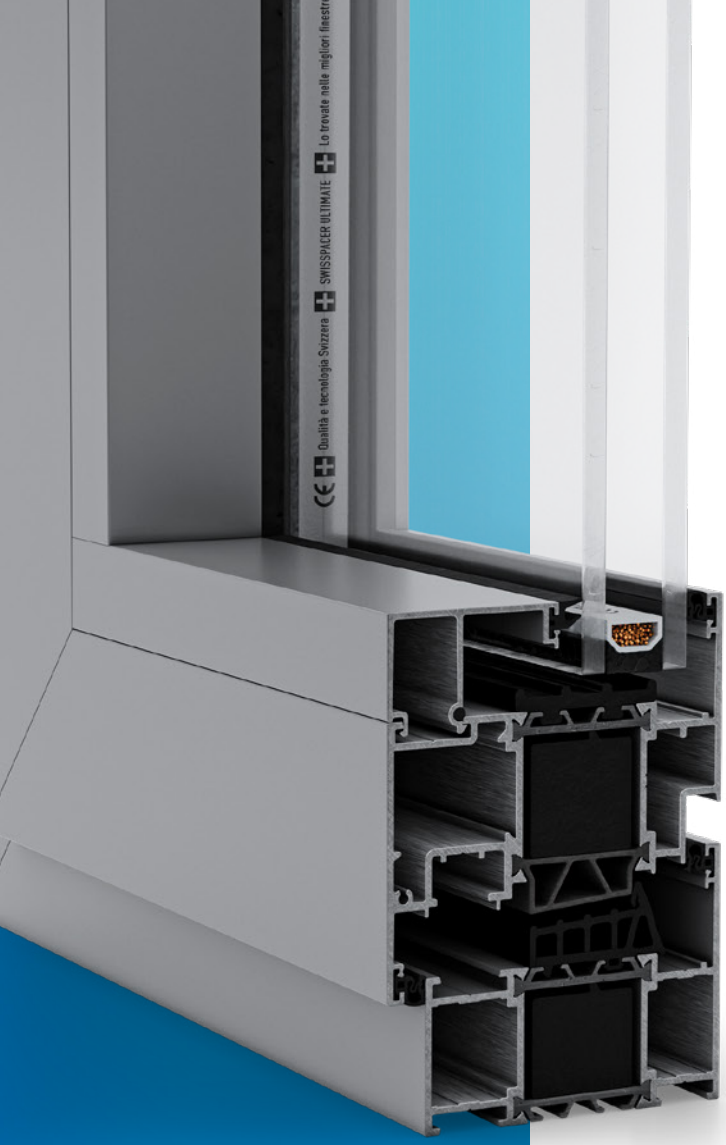

Why is the Entra system worth recommending?

The Entra system is a solution that combines elegance, functionality, and excellent technical parameters. It's the ideal choice for customers seeking modern and durable aluminum windows.

Adaptation to various climates

Three thermal versions of the profiles allow the use of Entra windows in both warm and cold climates, ensuring optimal comfort and energy efficiency.

Excellent technical parameters

- **Thermal insulation:**
  three profile versions (Standard, HI, HI+) meet thermal insulation requirements, minimizing heat loss and reducing energy costs.

- **Resistance to weather conditions:**
  Entra windows are characterized by high resistance to wind load (class C4) and 4th class air permeability, guaranteeing durability and reliability in all conditions.

- **Maximum protection:**
  triple-glazed units up to 63 mm thick provide excellent acoustic and thermal insulation, protecting against noise and extreme temperatures.

Attractive aesthetic lines

- **Design for every taste:** Entra windows are available in three aesthetic options: Standard, Steel, and Steel Flat, allowing them to be adapted to various architectural styles and customer preferences.

- **Modern look:** slim profiles and a minimalist finish give Entra windows a modern and elegant look that will enhance the aesthetics of any building.

The system is under development, and additional options will be implemented successively
